

01

### RATE OF A CHEMICAL REACTION

decrease in conc of reactant OR Increase in conc of reactant  
Time taken Time taken

### AVERAGE RATE

Consider a reaction:  $A + B \rightarrow C + D$

$$-\frac{\Delta[A]}{\Delta t} = -\frac{\Delta[B]}{\Delta t} = \frac{\Delta[C]}{\Delta t} = \frac{\Delta[D]}{\Delta t}$$

### INSTANTANEOUS RATE

Consider a reaction:  $aA + bB \rightarrow cC + dD$

$$-\frac{1}{a} \frac{d[A]}{dt} = -\frac{1}{b} \frac{d[B]}{dt} = \frac{1}{c} \frac{d[C]}{dt} = \frac{1}{d} \frac{d[D]}{dt}$$

Unit of Rate =  $\text{mol litre}^{-1} \text{s}^{-1}$

- Q During the decomposition of  $\text{H}_2\text{O}_2$ , 48 g  $\text{O}_2$  is formed per minute at a certain point of time. The rate of formation of water at this point is
- (a)  $0.75 \text{ mol min}^{-1}$  (b)  $1.5 \text{ mol min}^{-1}$   
(c)  $2.25 \text{ mol min}^{-1}$  (d)  $3.0 \text{ mol min}^{-1}$

02

### FACTORS INFLUENCING RATE OF REACTION

Factors	Effect on reaction rate
Increase in concentration	Increases
Increase in temperature	Increases
Presence of catalyst	Increases

- Q Which of the following will lead to an increase in the rate of the reaction?
- a) Decrease in temperature  
b) Decreasing concentration of reactants  
c) Addition of catalyst  
d) Addition of inhibitor

03

### RATE LAW

Consider a general reaction,  
 $aA + bB \rightarrow \text{product}$   
Rate =  $k[A]^x[B]^y$  (law of mass action)  
Rate =  $k[A]^x[B]^y$  (rate law expression)  
 $x$  &  $y$  are determined experimentally and may or may not be equal to  $a$  &  $b$   
 $x$  &  $y$  represents the order of reaction with respect to  $A$  &  $B$

### RATE CONSTANT

- Larger the value of  $k$ , faster is the reaction.
- The value of  $k$  changes only with temperature for given reaction.

Unit of rate constant =  $(\text{mol})^{1-x-y} \text{L}^{x+y} \text{s}^{-1}$

- Q The rate constant of a zero-order reactions has the unit
- (a)  $\text{s}^{-1}$  (b)  $\text{mol L}^{-1} \text{s}^{-1}$   
(c)  $\text{L}^2 \text{mol}^{-2} \text{s}^{-1}$  (d)  $\text{L mol}^{-1} \text{s}^{-1}$

04

### ORDER AND MOLECULARITY

Consider a general reaction,  
 $aA + bB \rightarrow \text{product}$   
Rate =  $k[A]^x[B]^y$   
molecularity =  $a + b$   
order =  $x + y$

Molecularity	Order
Theoretical concept. It cannot be zero, fractional, infinite and imaginary.	An experimentally determined quantity. It can be equal to zero, positive, negative and fractional.

- Q When the rate of the reaction is equal to the rate constant, the order of the reaction is
- (a) zero order  
(b) first order  
(c) second order  
(d) third order

05

### PSEUDO ORDER REACTIONS

Consider the reaction  
 $\text{C}_{12}\text{H}_{22}\text{O}_{11} + \text{H}_2\text{O} \xrightarrow{\text{H}^+} \text{C}_6\text{H}_{12}\text{O}_6 + \text{C}_6\text{H}_{12}\text{O}_6$   
In these reactions, concentration of water (one of the reactants) is in excess and its concentration remains constant throughout the reaction.  
Thus, rate  $\propto [\text{C}_{12}\text{H}_{22}\text{O}_{11}]$   
Therefore, order = 1

- Q For a pseudo first-order reaction, what is the unit of the rate of the reaction?
- (a)  $\text{s}^{-1}$   
(b)  $\text{mol L}^{-1} \text{s}^{-1}$   
(c)  $\text{mol}^{-1} \text{L s}^{-1}$   
(d)  $\text{mol}^{-2} \text{L}^2 \text{s}^{-1}$

## CHEMICAL KINETICS

06

### ELEMENTARY & COMPLEX REACTIONS

Reactions occurring only in one step are called elementary reactions while that involving a sequence of elementary reactions, are called complex reactions.

In case of complex reactions, the slowest step is called rate determining step.

**Note** Consider the reaction  
 $2\text{O}_3 \rightarrow 3\text{O}_2$   
Step - 1  
 $\text{O}_3 \rightleftharpoons \text{O}_2 + \text{O}$  (fast)  
Step - 2  
 $\text{O} + \text{O}_3 \rightarrow 2\text{O}_2$  (slow)

From slow step  
 $r = k[\text{O}][\text{O}_3]$   
Here  
 $[\text{O}] \propto [\text{O}_3]$  ; From fast step  
 $\frac{[\text{O}]}{[\text{O}_3]} = \frac{k_1}{k_2}$   
 $r = k[\text{O}_3]^2[\text{O}_3]^{-1}$

- Q Suppose the reaction:  $A + 2B \rightarrow AB_2$  occurs by the following mechanism:
- Step 1 :  $A + B \rightarrow AB$  slow  
Step 2 :  $AB + B \rightarrow AB_2$  fast  
Overall  $A + 2B \rightarrow AB_2$   
(a)  $k[A]$  (b)  $k[B]$  (c)  $k[A][B]$  (d)  $k[B]^2$

07

### INTEGRATED RATE EQUATIONS

Zero order

$$k = \frac{[A]_0 - [A]_t}{t}$$

First order

$$k = \frac{2.303 \log [A]_0}{t}$$

Second order

$$k = \frac{1}{t} \left[ \frac{1}{[A]_t} - \frac{1}{[A]_0} \right]$$

- Q A first order reaction has a specific reaction rate of  $10^{-2} \text{ sec}^{-1}$ . How much time will it take for 20 g of the reactant to reduce to 5 g?
- (a) 138.6 sec (b) 346.5 sec  
(c) 693.0 sec (d) 238.6 sec

08

### HALF LIFE PERIOD

Zero order

$$t_{1/2} = \frac{[A]_0}{2k}$$

First order

$$t_{1/2} = \frac{0.693}{k}$$

Second order

$$t_{1/2} = \frac{1}{k[A]_0}$$

### FIRST ORDER TRICKS

$$t_{75\%} = 2t_{1/2}$$

$$t_{90\%} = \frac{2.303}{k}$$

$$t_{99.9\%} = 10t_{1/2}$$

- Q The half-life period of zero order reaction is directly proportional to the \_\_\_\_\_
- a) Rate constant  
b) Initial concentration of reactants  
c) Final concentration of reactants  
d) Concentration of products

09

### GRAPHICAL REPRESENTATION

- Q The graph of  $t_{1/2}$  versus initial concentration 'a' is for
- a) First order  
b) Second order  
c) Zero order  
d) Can't predict

10

### ARRHENIUS EQUATION

$$k = Ae^{-E_a/RT}$$

$$\log k = \log A - \frac{E_a}{2.303R} \left( \frac{1}{T} \right)$$

**NOTE**

- For every  $10^\circ$  rise in temperature, rate becomes double and hence, rate constant becomes double.
- A reaction with higher value of  $E_a$  will have smaller value of rate constant.

- Q The slope of Arrhenius plot ( $\ln k$  vs  $1/T$ ) of first order reaction is  $-5 \times 10^3 \text{ K}$ . The value of  $E_a$  of the reaction is [Given:  $R = 8.314 \text{ J K}^{-1} \text{ mol}^{-1}$ ]
- (a)  $-83 \text{ kJ mol}^{-1}$  (b)  $41.5 \text{ kJ mol}^{-1}$   
(c)  $83 \text{ kJ mol}^{-1}$  (d)  $166 \text{ kJ mol}^{-1}$
